

Pointers

Dynamic Memory Allocation
malloc(), calloc() & free() functions

malloc()

- ▶ The name "malloc" stands for memory allocation.
- ▶ The malloc() function reserves a block of memory of the specified number of bytes.
- ▶ It returns a pointer of void which can be casted into pointers of any form.
- ▶ Syntax of malloc()

```
ptr = (castType*) malloc(size);
```

```
ptr = (float*) malloc(100 * sizeof(float));
```

The above statement allocates 400 bytes of memory. It's because the size of float is 4 bytes. And, the pointer ptr holds the address of the first byte in the allocated memory.

free()

- ▶ Dynamically allocated memory created with either `calloc()` or `malloc()` doesn't get freed on their own. You must explicitly use `free()` to release the space.
- ▶ Syntax of `free()`
`free(ptr);`
- ▶ This statement frees the space allocated in the memory pointed by `ptr`.

Example 1: malloc() and free()

// Program to calculate the sum of n numbers

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
int main()
```

```
{
```

```
    int n, i, *ptr, sum = 0;
```

```
    printf("Enter number of elements: ");
```

```
    scanf("%d", &n);
```

```
    ptr = (int*) malloc(n * sizeof(int));
```

```
    if(ptr == NULL)
```

```
    {
```

```
        printf("Error! memory not allocated.");
```

```
        exit(0);
```

```
    }
```

```
        printf("Enter elements: ");
```

```
        for(i = 0; i < n; ++i)
```

```
        {
```

```
            scanf("%d", ptr + i);
```

```
            sum += *(ptr + i);
```

```
        }
```

```
        printf("Sum = %d", sum);
```

```
        // deallocating the memory
```

```
        free(ptr);
```

```
        return 0;
```

```
    }
```

calloc()

- ▶ The name "calloc" stands for contiguous allocation.
- ▶ The malloc() function allocates memory and leaves the memory uninitialized. Whereas, the calloc() function allocates memory and initializes all bits to zero.
- ▶ Syntax of calloc()

```
ptr = (castType*)calloc(n, size);
```
- ▶ Example:

```
ptr = (float*) calloc(25, sizeof(float));
```
- ▶ The above statement allocates contiguous space in memory for 25 elements of type float.

calloc() and free()

// Program to calculate the sum of n numbers

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
int main()
```

```
{
```

```
    int n, i, *ptr, sum = 0;
```

```
    printf("Enter number of elements: ");
```

```
    scanf("%d", &n);
```

```
    ptr = (int*) calloc(n, sizeof(int));
```

```
    if(ptr == NULL)
```

```
    {
```

```
        printf("Error! memory not allocated.");
```

```
        exit(0);
```

```
    }
```

```
    printf("Enter elements: ");
```

```
    for(i = 0; i < n; ++i)
```

```
    {
```

```
        scanf("%d", ptr + i);
```

```
        sum += *(ptr + i);
```

```
    }
```

```
    printf("Sum = %d", sum);
```

```
    free(ptr);
```

```
    return 0;
```

```
}
```

Homework

What is wrong with the following program

```
#include <stdio.h>
#include <stdlib.h>

int main(int argc, char *argv[]) {

    int *a = malloc(sizeof(int));
    *a = 10;

    printf("%d\n", *a);

    a = calloc(3, sizeof(int));
    a[0] = 10;
    a[1] = 20;
    a[2] = 30;

    printf("%d %d %d\n", a[0], a[1], a[2]);

    return 0;
}
```
